PDF Report (AI-100 Final Project)

This semester's final project allowed me to gain basic experience building and debugging an AI system while learning a lot about generative AI. The most important thing I learned is that GenAI is NOT smarter than any human, and reinforced the concepts learned in class that GenAI is a tool that supports human reasoning. In Case 5, I modified the training data so that the images in the dataset no longer matched their correct classes. I was surprised by how bad the model failed after this change. Instead of magically finding a way to properly train off the modified data, the model essentially began to randomly guess because it was being trained on incorrect information. This bug demonstrated to me that even a great AI system cannot find a way to learn correct patterns from incorrect or weak data. My takeaway is how important quality data is when building and training an AI system.
